

1. In this method, I want to draw a bar graph similar to existing, But It has a new entry added to every bar. Which represents avg of that value for the field. Which is like a comparator operator between the both bars.

2. Here I want to draw a line graph on the bar graph. Where the line graph is avg of all the values. So even the bars change, we can see a relative position of the line graph, so the comparison is easier.

3. In this method , I would like to implement one more bar graph with a fixed set of Bar graph. So the relativity can be identified. I implemented this in my code.

Relative positioning of Bar graph vs Bar graph
